

# PreCalculus F1 CN Functions and Their Representations

## Function Notation

The notation  $y = f(x)$  is called **function notation**. The **input** is  $x$ , the **output** is  $y$ , and the *name* of the function is  $f$ .

$$y = f(x)$$

$$f(t)$$

## Function Concept and Representations

### Numerical Representation (Table of Values)

The following table lists the approximate distance  $y$  in miles between a person and a bolt of lightning when there is a time lapse of  $x$  seconds between seeing the lightning and hearing the thunder.

$x$ (seconds)	5	10	15	20	25
$y$ (miles)	1	2	3	4	5

### Verbal Representation (Words)

In the lightning example,

“Divide  $x$  seconds by 5 to obtain  $y$  miles.”

OR

“ $f$  calculates the number of miles from a lightning bolt when the delay between thunder and lightning is  $x$  seconds.”

### Graphical Representation (Graph)

### Symbolic Representation (Formula)

In the lightning example,

$$f(x) = \frac{x}{5}$$

$$f(x) = \frac{1}{5}x$$

## Domain and Range of a Function

The set of all meaningful inputs  $x$  is called the **DOMAIN** of the function.

Algebraic Domain Rules:

1.

$$\text{denom} \neq 0$$

2.

$$\sqrt{\text{stuff}} \quad \text{stuff} \geq 0$$

$$y = \frac{1}{x-3} \quad x-3=0 \quad \left. \begin{matrix} \text{R} \\ \text{D} \end{matrix} \right\} x \neq 3$$

$$y = \sqrt{x-5} \quad x-5 \geq 0 \quad x \geq 5$$

The set of corresponding outputs  $y$  is called the **RANGE** of the function.

A function  $f$  that computes the height after  $t$  seconds of a ball thrown into the air, has a domain that might include all the times while the ball is in flight, and the range would include all heights attained by the ball.

## Formal Definition of a Function

A **function** is a relation in which each element of the domain corresponds to exactly one element in the range.

(The ordered pairs for a function can be either finite or infinite.)

Do the following relations of ordered pairs represent a function?

(1, 2) (1, 3)

NO

(1, 2) (2, 3)

yes

(1, 2) (2, 2)

yes

## Identifying Functions: Vertical Line Test

If every vertical line intersects a graph at no more than one point, then the graph represents a function. If a vertical line intersects a graph more than once, then the graph does *not* represent a function.

### Example 9: Identifying a function graphically

Use the vertical line test to determine if the graph represents a function.

### Set Builder Notation

The expression  $\{x \mid x \neq -1, x \neq 1, x \text{ is a real number}\}$  is written in **set-builder notation** and represents the set of all real numbers  $x$  such that  $x$  does not equal  $-1$  and  $x$  does not equal  $1$ .

Another example  $\{y \mid 1 < y < 5, y \text{ is a real number}\}$  is which represents the set of all real numbers  $y$  such that  $y$  is greater than  $1$  and less than  $5$ .

### Example 3: Evaluating a function and determining its domain

Let a function  $f$  be represented symbolically by  $f(x) = \frac{x}{x^2 - 1}$ .

a. Evaluate  $f(3)$

$$= \frac{3}{(3)^2 - 1} = \frac{3}{8}$$

b. Evaluate  $f(a+1)$

$$\frac{a+1}{(a+1)^2 - 1} = \frac{a+1}{a^2 + 2a}$$

c. Find the domain of  $f$ .

$$x^2 - 1 = 0$$

$$\sqrt{x^2} = \sqrt{1}$$

$$x = \pm 1 \quad \left\{ x \mid x \neq -1, x \neq 1, \mathbb{R} \right\}$$

equation / algebraically

**Example 4: Evaluating a function symbolically and graphically**

A function  $g$  is given by  $g(x) = x^2 - 2x$ , and its graph is shown.

(a) Find the domain of  $g$ .

$\mathbb{R}$

(b) Use  $g(x)$  to evaluate  $g(-1)$ .

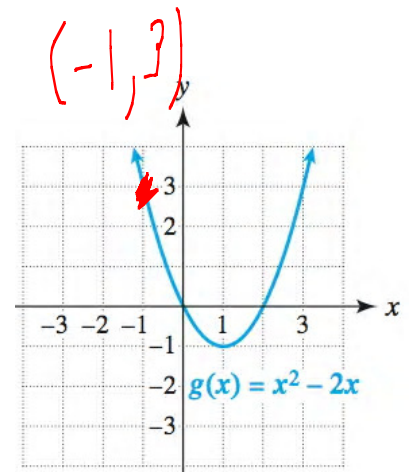

$$= (-1)^2 - 2(-1)$$

$$= 3$$

(c) Use the graph of  $g$  to evaluate  $g(-1)$ .

$= 3$

*(Handwritten red arrows point from the '3' to the x-axis and y-axis)*

**Example 5: Find the domain and range graphically**

A graph of  $f(x) = \sqrt{x-2}$  is shown. Find the domain and range of  $f$ .

$x-2 \geq 0$       $D: x \geq 2$

$R: y \geq 0$

**Example 10: Identifying a function**

Determine if  $y$  is a function of  $x$ .

a.  $x = y^2$

$(4, 2)$     $(4, -2)$      No

b.  $y = x^2 - 2$

yes

c.  $y^2 + y^3 = x$

even exp     dot a fun

d.  $x = 1$      No

$x = y^0$
